Breakthrough for Housekeepers

Increasing competition in the hospitality industry is resulting in housekeeping staff now having an 85% higher risk of injury than non-housekeeping staff due to heavier, more luxurious beds.

The Ezi-Maid Bed Lifting System is an innovative new product that was designed to guarantee the reduction of injuries related to bed making. The device also makes it possible to clean under beds and provide a cleaner, healthier environment for staff and guests alike.

The Ezi-Maid Bed Lifting System fits to your existing beds and operates by an infrared remote control. The device lifts the bed up off the floor to waste height so housekeeping staff can make the bed standing up. Not only will this reduce the amount of injuries for the housekeeping staff, but also means that hotel owners can potentially expect significant reduction in workers compensation claims, resulting in increased profits.

The future for housekeeping jobs is now secure. With less chance of injury and higher job satisfaction, staff turnover will be drastically reduced. This also means an increase in profitability for the hotel as they don't have to utilize valuable resources through personnel companies for replacement staff. Housekeepers who have used the Ezi-Maid Bed Lifting System have said, "We would not be able to stay in the industry without the Ezi-Maid product installed in our hotel."

Not only can the Ezi-Maid Bed Lifting System be installed for less than the cost of a pillow case per night, it will increase the productivity of staff and increase hotel profitability. It will also create a happier environment for housekeeping staff, and provide a cleaner, healthier environment for guests.

The Ezi-Maid Bed Lifting System has the potential to be an industry standard as rising pressure to win the "war of the beds" is making housekeeping an increasingly demanding occupation.
